

CURRENTFLOW

IDX SMART-MONEY BUY-SIGNAL FLOW

How a stock becomes a

buy candidate · LOCKED_SPEC v1.2 §2

RULE A — Tradeability gate (LD-2)

Only Wyckoff Accumulation Phase C/D is tradeable.

RULE B — Presentation gate (LD-9)

No number shown until paper-validated (3 mo).

1 INGEST

OHLCV · broker summary · NBSA foreign flow · corp actions · float · financials. Every datum stamped as_of; missing ≠ zero.

2 UNIVERSE GATE (§3)

Hard liquidity floor: ADV ≥ 10bn, price ≥ 100, not suspended, not ARA/ARB-pinned. Assign Track A (large-cap) / B (lapis-2).

3 PHASE CLASSIFIER — RULE A HARD GATE

Wyckoff phase. PASS only if Accumulation Phase C or D. Everything else is rejected here, before any scoring.

4 SMART MONEY SCORE (§4)

Track-weighted: Price-Volume Divergence (spine) + broker concentration + foreign flow (A only) + RVOL + blocks. SMS 0–100 — INTERNAL, number hidden (RULE B).

5 VETO FILTERS (§5)

Hard reject regardless of score: single-bandar monopoly, distribution-dressed, markup-on-thin-vol, wash/churn, broker rotation, retail-FOMO, news.

SMS ≥ 70 AND phase ∈ {C,D} AND no veto

→ state = ARMED (watchlist — observation, not a recommendation)

6 TECHNICAL TRIGGER (LD-3)

Spring-test OR LPS. Compute stop + R:R. Require R:R ≥ 2:1 or skip.

7 FUNDAMENTAL TILT (LD-6/7)

Magic Formula rank → conviction × & hold horizon. Never a gate.

8 ORDER GEN

LIMIT order @ trigger. Size to 1% risk × conviction. Exposure caps.

9 PAPER FILL (§12)

Next-open + slippage. Lots/ticks/ARA-ARB. FULL fee stack. No live exec.

The buy signal is a survivor, not a pick.

A name reaches ARMED only after passing the liquidity gate, the Phase C/D gate (RULE A), scoring ≥ 70, and clearing every veto.

It is then framed as an observation to act on manually — the engine never says “buy”, and no score is shown until a module is paper-validated (RULE B).

Do the tabs each surface a “positive” (buy) signal?

No. The 8 modules are observation lenses on flow. Only ONE produces a ranked buy claim — and only after validation.

PURE OBSERVATION — ships now, no gate

- **Broker Flow Analyzer** per-broker net buy/sell, DNA, concentration, persistence
- **Foreign Flow Dashboard** NBSA magnitude/persistence, reversal, KSEI ownership
- **Accumulation Detector** stealth divergence: price flat while accumulation rises
- **Money Flow Replay** scrub history from stored as_of — the audit tool

DERIVED VIEWS — rendering, no new claim

- **Smart Money Heatmap** flow direction × intensity, sector→stock→broker drill
- ❖ **Sector Rotation Map** RS-vs-flow quadrant: leaders / distribution warning

RISK OBSERVATION — not a return prediction

- **Portfolio Risk Monitor** crowding, exposure caps, VaR, circuit breakers

GATED — NO number until paper-validated (RULE B)

- Σ **SMS / AI Buy-Sell Rank** the ONLY buy/sell tab. Shows *** until VALIDATED, then SMS 0–100

Why most tabs are NOT “positive signals”

- A tab's job is to show the flow honestly — including negative flow, distribution, and traps — not to hunt for a reason to buy.
- Every module carries a trap/decay ribbon (§5 vetoes + §8 decay). Surfacing a red flag is a valid, first-class output.
- The single buy/sell-ranked tab (SMS / Rank) is gated: pre-validation it renders *** and “flow-derived, not a recommendation.”
- Framing is always observation (“here is the flow, you decide”), never advice. The paper-trade engine alone promotes observation → claim.
