

IDX Smart-Money Screener — Locked Specification v1.1

Status: LOCKED. This resolves the eight contradictions from CONSOLIDATED_THESIS.md into single, non-negotiable decisions. Build to this; changes require a version bump and a documented reason.

Changelog — v1.1 (2026-06-30): §5 veto filters extended with the finer **trap taxonomy** (markup-on-thin-volume, wash/churn, broker rotation), absorbed from the detection-layer spec (screener/CONSOLIDATED_SCREENERSPEC.md). *Reason:* the single “distribution-dressed-as-accumulation” veto was coarse; these three named sub-screens catch pump, manufactured-volume, and disguised-single-player manipulation it misses. No decision (LD-1...LD-8), weight, or threshold changed.

Core thesis (unchanged): Smart-money flow *leads* -> technical structure *confirms timing* -> fundamental quality *sizes conviction & hold horizon*. EOD/T+1 cadence. Long-only. Liquidity-gated.

1. Decision Log — the eight, resolved

#	Contradiction	LOCKED DECISION	Rationale
LD-1	Signal hierarchy	Price-Volume Divergence is the universal spine. Confirming-leads are tier-dependent: Track A (large-cap) = NBSA foreign flow + broker concentration co-lead; Track B (lapis-2) = broker concentration leads, foreign flow excluded. Weights locked in §4.	Foreign flow only reliable on foreign-held large-caps; broker concentration is the lapis-2 signal. Divergence is confirmed by every source.
LD-2	Cycle-phase blindness	Wyckoff phase classifier is a HARD GATE before scoring. Only Accumulation Phase C or D is tradeable. Threshold detectors <i>feed</i> the classifier; they never bypass it.	A volume/flow threshold with no phase context buys distribution tops. This is the #1 edge-vs-artifact decision.
LD-3	Entry discipline	Grimes wins. No market-on-signal. A passing score sets state = ARMED, not ENTER. Entry requires a confirmation trigger (Spring-test or LPS) via limit order , and R:R ≥ 2:1 or no trade.	Paper 3 agrees on mechanics (next-open + ARA/ARB make market fills fiction anyway).
LD-4	Universe direction	Hard liquidity floor is absolute (§3). Within the liquid set, an index-rebalancing filter down-weights pure-beta moves. Never chase illiquidity for alpha.	Resolves “non-benchmark alpha” vs “stay liquid”: stay liquid, then strip index noise <i>inside</i> the liquid set.

#	Contradiction	LOCKED DECISION	Rationale
LD-5	Data cadence	EOD/T+1 first. Scheduler fires on broker-summary publication , not market close. Real-time tick / L2 order book DEFERRED to Phase 2+, added only if an intraday signal proves incremental edge.	The binding signal (broker summary) is EOD. Low-latency architecture is over-engineering for a T+1 signal.
LD-6	Fundamental layer	Present, as a conviction/horizon TILT — not an entry gate. Metric = Magic Formula (EY = EBIT/EV, ROC = EBIT/(NWC+NFA)) . Reject ROE/PE/PB.	ROE/PE/PB distorted by leverage — fatal on a bank-heavy index. Fundamentals decide <i>how much / how long</i> , not <i>whether to enter</i> .
LD-7	Financials-exclusion paradox	Dual-track scoring. Financials (bank/insurance/multifinance) + utilities run flow+technical only , scored with sector proxies (banks: ROE, NIM, CAR), flagged FLOW_ONLY → shorter hold, tighter trail. They stay in the universe.	They are the most liquid, most Wyckoff-able, most foreign-flow-driven names. Excluding them discards the best universe.
LD-8	ML vs overfitting	Deferred to Phase 4+ and gated. Rules system must first show ≥3 months forward-paper with positive walk-forward Sharpe . ML role = signal-weight optimizer / ranker on engineered features ONLY — never a black-box entry generator. Mandatory purged/embargoed CV + out-of-sample.	Reflexive, non-stationary, small-sample IDX flow data overfits trivially.

2. Pipeline (locked)

SCHEDULER (fires on broker-summary publication, ~T+0 evening / T+1)
 | look-ahead control: every datum stamped with availability_ts;
 | a signal may use a datum ONLY IF availability_ts < decision_ts

▼

[1] INGEST OHLCV · broker summary · NBSA foreign flow · corp actions ·
 halt/suspend flags · KSEI ownership · financials (TTM)

▼

[2] UNIVERSE GATE (\$3) — hard liquidity floor; assign Track A / B; tag sector

▼

[3] PHASE CLASSIFIER (LD-2) — Wyckoff phase; PASS only if Phase C or D accumulation

▼

[4] SMART MONEY SCORE (§4) – track-specific weights -> SMS 0–100
▼
[5] VETO FILTERS (§5) – kill single-bandar / distribution / markup / wash / rotation / news
▼
SMS ≥ 70 AND phase $\in \{C,D\}$ AND no veto -> state = ARMED (watchlist)
▼
[6] TECHNICAL TRIGGER (LD-3) – Spring-test OR LPS; compute stop + R:R; require R:R $\geq 2:1$
▼
[7] FUNDAMENTAL TILT (LD-6/7) – MF rank (or sector proxy) -> conviction & hold horizon
▼
[8] ORDER GEN – limit @ trigger; size to 1% risk (§6)
▼
[9] PAPER FILL ENGINE – next-open + slippage; lot=100; tick bands; ARA/ARB reject; FULL fee stack (broker + levy + VAT + 0.1% sell tax)
▼
[10] RISK / EXIT MGR (§6,§7) – stop · target · trailing · signal-decay exit
▼
[11] BACKTEST <-> FORWARD-PAPER (separate code paths, shared fill engine)
▼
[12] DASHBOARD – P&L, armed list, flow, attribution vs benchmark (§8)

3. Universe Gate (LD-4) – locked thresholds

Hard floor (all must pass): - 20-day avg daily value traded $\geq$ IDR 10 bn - Last price $\geq$ IDR 100 - Not suspended; not IPO with < 60 trading days of history - Did not close ARA/ARB-pinned on the signal day (no fillable band -> reject)

Track assignment: - **Track A** — member of LQ45/IDX80 AND ADV $\geq$ IDR 25 bn -> foreign-flow-reliable - **Track B** — passes hard floor, not Track A -> broker-concentration-reliable

Index-rebalancing filter: if a candidate's move is explained by index/sector beta (rolling β -adjusted return ~ sector return, flow concentrated on index-tracker brokers near rebalance dates), **down-weight SMS by 30%**. Don't reject — just stop paying alpha prices for beta.

4. Smart Money Score (LD-1) – locked weights (0–100)

Component	Track A (large-cap)	Track B (lapis-2)
Price-Volume Divergence (high vol, $\leq \pm 0.5\%$ price; corr < 0.3 on high-vol bars)	30	30
Broker concentration (top-2 net-buy share, $\geq N$ consecutive days, on flat/down bars)	20	35
NBSA foreign-flow accumulation (net buy > 2× 20d avg, rising)	25	0
Volume anomaly / RVOL (> 3× 20d avg)	10	15
Block-trade footprint (> IDR 1B or > 1% ADV)	5	10
Wyckoff phase-alignment bonus (Spring/LPS proximity)	10	10

SMS ≥ 70 = ARMED threshold (locked). Weights are the **only** tunable surface, and only via backtest Sharpe maximization with walk-forward — never hand-edited live.

5. Veto Filters (hard reject regardless of SMS)

Manipulation / trap detectors:

- **Single-bandar monopoly** — one broker > 60% of net-buy concentration (gameable).
- **Distribution-dressed-as-accumulation** — high volume + up-bars closing in lower half / UTAD / no-demand rallies / dominant buyer flipping to net sell.
- **Markup-on-thin-volume** — price spiking on low value traded (pump signature, not real demand).
- **Wash / churn** — same broker showing high buy AND high sell (manufactured volume to bait followers).
- **Broker rotation** — buying baton passing between related/correlated broker codes (one player disguised as many; flag correlated-broker behaviour).

Noise / context filters:

- **Retail-FOMO** — retail buy ratio > 60% of volume.
 - **Event-driven** — material news in window (flow is reacting, not leading).
 - **Phase mismatch** — anything not Phase C/D (enforced at [3], restated here).
-

6. Entry, Sizing, Risk (LD-3) — locked

- **Trigger:** close of Spring-test bar (narrow spread, low vol, holds above spring low) **OR** LPS pullback after SOS.
 - **Order:** limit at/below trigger price. No market orders.
 - **Stop:** below spring low / swing low (thesis-invalidating level). Never widened.
 - **R:R:** $\geq 2:1$ to first structural target (AR high / next HVN) or **skip**.
 - **Position size:** $\text{qty} = (\text{equity} \times 1\%) / (\text{entry} - \text{stop})$, rounded down to whole lots. **Risk locked at 1%** (not 2% — IDX manipulation tax).
 - **Conviction multiplier from \$7:** compounder $\times 1.0$; speculative $\times 0.5$.
 - **Exposure caps:** $\leq 10\%$ equity per name; $\leq 30\%$ per sector; correlated-pair check.
 - **Circuit breakers:** halt new entries at -3% daily P&L; pause system at -10% peak-to-trough drawdown.
-

7. Fundamental Tilt (LD-6/7) — locked

Non-financials/non-utilities: compute Magic Formula combined rank (EY + ROC). - Top tercile -> COMPOUNDER: full size ($\times 1.0$), hold through markup, wide trailing stop. - Mid -> NEUTRAL: $\times 0.75$, standard trail. - Bottom tercile / negative EBIT -> SPECULATIVE: $\times 0.5$, tight trail, exit at first target.

Financials + utilities (FLOW_ONLY): skip MF. Sector proxy sanity check only (banks: ROE > 12%, CAR healthy). Default to $\times 0.75$, shorter hold, tighter trail. Quality proxy can promote to $\times 1.0$ but never to COMPOUNDER hold rules.

Fundamentals **never block an entry** — they only set the multiplier and hold horizon.

8. Exit, Benchmark, Validation — locked

Exit (any one triggers): stop hit · target hit · trailing stop · **signal-decay** (NBSA flips negative / dominant broker flips to net sell / VPA prints UTAD or no-demand / phase rolls to distribution).

Benchmark (LD per source): Track A -> LQ45. Track B -> relevant sector index (or IDX SMC index). **Never IHSG** as the headline benchmark.

Metrics tracked: total/annualized return, Sharpe, max drawdown, hit rate, **turnover** (flow strategies churn; fees punish churn), and **return net of full fee stack** (the only number that counts).

Validation gate to advance a phase: walk-forward + out-of-sample only; backtest and forward-paper are separate code paths sharing the fill engine; survivorship + look-ahead controls mandatory.

9. Build Order (locked phasing)

1. **Foundation** — ingest (OHLCV + broker summary + NBSA, with availability timestamps), universe gate, manual armed-list alerts. Validate signal quality 2–4 weeks before automating.
 2. **Signal** — phase classifier + SMS + veto filters; backtest 2+ yrs with fees & look-ahead controls.
 3. **Execution** — technical-trigger logic, fundamental tilt, fill engine (fees/ARA-ARB/lots/ticks), risk mgr; run forward-paper.
 4. **Scale / ML (gated)** — only after ≥ 3 months positive forward-paper walk-forward Sharpe; ML as ranker/weight-optimizer with purged CV.
-

10. Acceptance Criteria (definition of done for v1.1 rules engine)

- ☐ No signal consumes data with $\text{availability_ts} \geq \text{decision_ts}$ (look-ahead test passes).
 - ☐ Phase gate rejects all non-C/D candidates (unit-tested on labeled charts).
 - ☐ Veto filters reject markup-on-thin-volume / wash-churn / broker-rotation cases (unit-tested on labeled examples).
 - ☐ Every order is a limit order with a defined stop and $R:R \geq 2:1$.
 - ☐ Fill engine reproduces lot/tick/ARA-ARB/fee math against hand-checked cases.
 - ☐ Backtest and forward-paper share one fill engine; results reconcile.
 - ☐ Reported return is net of the full fee stack and benchmarked to LQ45/sector, not IHSG.
 - ☐ No live hand-editing of SMS weights; tuning only via walk-forward optimizer.
