

# IDX Money-Flow Screener — Detection-Layer Spec

**Subordinate to LOCKED\_SPEC.md v1.0.** This document is the detection-layer feature library for the system defined in LOCKED\_SPEC. It details how the signals in pipeline steps **[2] Universe Gate -> [5] Veto Filters** are computed, consolidated from the four screener PDFs in this folder (CompleteSet, Spec, Funnel, Framework).

**Conflict rule:** where this document and LOCKED\_SPEC differ, **LOCKED\_SPEC wins**. All thresholds, weights, and gates below are inherited from LOCKED\_SPEC and are not independently tunable here. Aligned 2026-06-30.

Informational/educational only — not financial advice. Paper results do not guarantee live performance.

## Relationship to LOCKED\_SPEC

LOCKED\_SPEC is the authoritative end-to-end system (screen -> arm -> trigger -> size -> fill -> validate). This spec is the **brain that feeds its front half** — the detection features and disqualifiers. Mapping:

| This document                | LOCKED_SPEC pipeline step                    |
|------------------------------|----------------------------------------------|
| §1 Universe gate             | [2] UNIVERSE GATE (LD-4)                     |
| §2 Phase gate                | [3] PHASE CLASSIFIER (LD-2)                  |
| §3 Detection features -> SMS | [4] SMART MONEY SCORE (LD-1, §4)             |
| §4 Veto filters              | [5] VETO FILTERS (§5)                        |
| §5 ARMED condition           | gate to state = ARMED                        |
| §6 Confirmation / entry      | [6] TECHNICAL TRIGGER (LD-3) — by reference  |
| §7 Fundamental tilt          | [7] FUNDAMENTAL TILT (LD-6/7) — by reference |
| §8 Risk / exit               | [10] RISK / EXIT MGR — by reference          |

Everything downstream of ARMED (order generation, fill engine, fees, backtest vs forward-paper, dashboard, acceptance criteria) lives **only** in LOCKED\_SPEC.

## What changed to align (from the prior standalone v0)

The earlier standalone consolidation made four choices that LOCKED\_SPEC overrides. They have been removed here:

1. **Added a hard phase gate.** Accumulation is no longer purely scored — a Wyckoff phase classifier (Phase C/D only) is now a hard gate *before* scoring. Hard gates are now: universe, phase, veto (was: eligibility + risk only).
2. **Fundamentals are a multiplier, not score points.** Dropped the additive +15 fundamental weight; fundamentals now only set a size/hold multiplier and never affect the arming score.
3. **Fundamental metric is Magic Formula (EY + ROC).** Dropped ROE/PE/PB.
4. **Dual-track scoring** (large-cap vs lapis-2) replaces the single weight vector. Numeric floors raised to LOCKED\_SPEC levels; IHSG dropped as a benchmark.

## §1 Universe gate [HARD] — LD-4

Run first; cheap, brutal. Fail any -> dropped, never scored.

**Hard floor (all must pass):**

| Filter                               | Threshold          |
|--------------------------------------|--------------------|
| 20-day avg daily <b>value</b> traded | ≥ <b>IDR 10 bn</b> |
| Last price                           | ≥ <b>IDR 100</b>   |
| State                                | not suspended      |

| Filter           | Threshold                                                        |
|------------------|------------------------------------------------------------------|
| Listing history  | <b>not</b> IPO with < 60 trading days                            |
| Signal-day close | did <b>not</b> close ARA/ARB-pinned (no fillable band -> reject) |

**Track assignment** (decides which signals are reliable, §3):

- **Track A** — member of LQ45/IDX80 **AND** ADV  $\geq$  IDR 25 bn -> *foreign-flow-reliable*.
- **Track B** — passes the hard floor but not Track A (liquidity-gated lapis-2) -> *broker-concentration-reliable*.

**Index-rebalancing filter:** if a candidate's move is explained by index/sector beta (rolling  $\beta$ -adjusted return ~ sector return, flow concentrated on index-tracker brokers near rebalance dates), **down-weight SMS by 30%** — do not reject. Don't pay alpha prices for beta.

*Data: broker summary, daily value traded, float, index membership, state/listing flags.*

## §2 Phase gate [HARD] — LD-2

A Wyckoff phase classifier runs **before** scoring. **PASS only if Accumulation Phase C or D** (Spring/shakeout, or SOS -> LPS). Reject Phase A/B (noise) and anything printing BC/UTAD/distribution. The detection features in §3 feed this classifier — they never bypass it. This is the #1 edge-vs-artifact decision: a volume/flow threshold with no phase context buys distribution tops.

*Data: range structure, VPA effort-vs-result, accumulator VWAP vs price.*

## §3 Detection features -> Smart Money Score (SMS) — LD-1 / §4

Each feature is computed on the liquid, Phase-C/D universe and combined into **SMS (0–100)** with **track-specific weights**. Weights are the *only* tunable surface and only via backtest Sharpe maximization with walk-forward — never hand-edited live.

| Feature                                             | Definition (anchor)                                               | Track A   | Track B   |
|-----------------------------------------------------|-------------------------------------------------------------------|-----------|-----------|
| <b>Price-Volume Divergence</b> ( <i>the spine</i> ) | high volume, price $\leq \pm 0.5\%$ , corr < 0.3 on high-vol bars | <b>30</b> | <b>30</b> |
| <b>Broker concentration</b>                         | top-2 net-buy share, $\geq$ N consecutive days, on flat/down bars | 20        | <b>35</b> |
| <b>NBSA foreign-flow accumulation</b>               | net buy > 2× 20-day avg, rising                                   | <b>25</b> | 0         |
| <b>Volume anomaly / RVOL</b>                        | > 3× 20-day avg                                                   | 10        | 15        |
| <b>Block-trade footprint</b>                        | > IDR 1 B or > 1% ADV                                             | 5         | 10        |
| <b>Wyckoff phase-alignment bonus</b>                | Spring/LPS proximity                                              | 10        | 10        |

**Supporting detection signals** (feed the features above + the §2 phase gate; not separately weighted):

- **Persistence** — the same small broker set net-buying across consecutive sessions (qualifies broker concentration; one-day blips don't count).
- **Accumulator VWAP** — dominant-accumulator est. avg price vs current price. Near/below current = not yet marked up (supports Phase C/D); far above = distribution risk (feeds §8 signal-decay).

- **Absorption** (L2, optional / Phase 2+) — large sell pressure repeatedly absorbed without price dropping; VPA stopping-volume / no-supply confirmation.

SMS  $\geq 70$  is the ARMED threshold (locked, §5).

Data: EOD/15-min broker summary, broker classification map, NBSA foreign flow, OHLCV/RVOL, VWAP engine, L2 depth (optional).

## §4 Veto filters [HARD reject, regardless of SMS] — §5

Any one triggered -> killed even at SMS 100.

- **Single-bandar monopoly** — one broker > 60% of net-buy concentration (gameable). *Note: concentration is bullish up to this point; monopoly past it is not.*
- **Distribution-dressed-as-accumulation** — high volume + up-bars closing in lower half / UTAD / no-demand rallies / dominant buyer flipping to net sell.
- **Retail-FOMO** — retail buy ratio > 60% of volume.
- **Event-driven** — material news in window (flow is reacting, not leading).
- **Phase mismatch** — anything not Phase C/D (enforced at §2, restated here).

**Trap taxonomy.** The distribution veto above is the coarse gate; these finer screens — carried over from the Funnel source and **adopted into LOCKED\_SPEC §5 as of v1.1** — sharpen it and feed §8 signal-decay:

- **Markup-on-thin-volume** — price spiking on low value traded (pump, not demand).
- **Wash / churn** — same broker showing high buy AND high sell (manufactured volume).
- **Broker rotation** — buying baton passing between related/correlated broker codes (one player disguised as many).

## §5 ARMED condition

SMS  $\geq 70$  AND phase  $\in \{C, D\}$  AND no veto -> state = ARMED (watchlist)

ARMED is **not** an entry. It sets the watchlist; entry requires the §6 trigger. (Replaces the prior 5-band action scale; LOCKED\_SPEC uses this state machine.)

## §6 Confirmation / entry [by reference – LD-3]

Detailed in LOCKED\_SPEC §6; summarized for completeness:

- **Trigger:** close of Spring-test bar (narrow spread, low vol, holds above spring low) **OR** LPS pullback after SOS. Enter on the test, not the breakout impulse.
- **Order:** limit at/below trigger. No market orders.
- **Stop:** below spring low / swing low (thesis-invalidity). Never widened.
- **R:R  $\geq 2:1$**  to first structural target (AR high / next HVN) or **skip**.
- **Relative strength** vs LQ45 / sector confirms the candidate isn't just riding market beta. **Benchmark: Track A -> LQ45, Track B -> sector index. Never IHSG.**

## §7 Fundamental tilt [multiplier only – by reference, LD-6/7]

Fundamentals **never block an entry** — they set the conviction multiplier and hold horizon only.

- **Non-financials / non-utilities:** Magic Formula combined rank (EY = EBIT/EV, ROC = EBIT/(NWC+NFA)). Top tercile -> **COMPOUNDER  $\times 1.0$**  (hold through markup, wide trail); mid -> **NEUTRAL  $\times 0.75$** ; bottom / negative EBIT -> **SPECULATIVE  $\times 0.5$**  (tight trail, exit at first target). **Reject ROE/PE/PB** (leverage-distorted on a bank-heavy index).

- **Financials + utilities (FLOW\_ONLY):** skip Magic Formula; sector-proxy sanity only (banks: ROE > 12%, CAR healthy). Default  $\times 0.75$ , shorter hold, tighter trail; may promote to  $\times 1.0$  but never to COMPOUNDER hold rules.
- 

## §8 Risk / exit [by reference – LD-3 / §8]

- **Position size:**  $\text{qty} = (\text{equity} \times 1\%) / (\text{entry} - \text{stop})$ , rounded down to whole lots. Risk locked at **1%**. Multiplied by the §7 conviction multiplier.
  - **Exposure caps:**  $\leq 10\%$  equity per name;  $\leq 30\%$  per sector; correlated-pair check.
  - **Circuit breakers:** halt new entries at  $-3\%$  daily P&L; pause system at  $-10\%$  peak-to-trough drawdown.
  - **Exit (any one):** stop · target · trailing stop · **signal-decay** — NBSA flips negative / dominant broker flips to net sell / VPA prints UTAD or no-demand / phase rolls to distribution.
- 

## Cadence & build order (inherited)

- **Cadence:** EOD / T+1, scheduler fires on **broker-summary publication** (not market close); look-ahead control  $\text{availability\_ts} < \text{decision\_ts}$ . Real-time tick / L2 (absorption, iceberg) deferred to Phase 2+.
- **Build order** (LOCKED\_SPEC §9): Foundation (ingest + universe gate) -> Signal (phase classifier + SMS + veto) -> Execution (trigger + tilt + fill + risk) -> Scale/ML (gated: only after  $\geq 3$  months positive forward-paper walk-forward Sharpe; ML as ranker/weight-optimizer on engineered features with purged CV — never a black-box entry generator).
