

Complete Screener Set for Big Money Flow Detection Indonesia Stock Exchange (IDX)

All Data Access Scenario — Full Technical Specification

Overview

This document specifies the complete set of screeners required to detect institutional ('big money') capital flows in the Indonesia Stock Exchange under the assumption of full data access. Screeners are organized into eight tiers, from high-frequency real-time detection to low-frequency contextual validation, plus a composite scoring engine and noise filter.

Screener Tier Summary

Tier	Screener Name	Frequency	Purpose
1A	Volume Anomaly Detector	1-5 min	Detect institutional volume spikes
1B	Price-Volume Divergence	1-5 min	Identify stealth accumulation
1C	Block Trade Alert	Real-time	Catch large off-market transactions
2A	Broker Clustering	15-30 min	Detect coordinated institutional flow
2B	Broker Code Velocity	15-30 min	Track sudden broker interest spikes
3A	Foreign Net Flow Spike	Daily / Intraday	Monitor foreign smart money
3B	Foreign Broker Fingerprint	Daily / Intraday	Identify specific institution activity
4A	Iceberg Order Detection	1-3 min	Reveal hidden large orders
4B	Order Book Imbalance	1-3 min	Measure buying pressure buildup
5A	Sector Rotation Flow	30-60 min	Detect sector-level big money
5B	ADR / Global Proxy Flow	30-60 min	Confirm with global sentiment
6A	Ownership Change Alert	Daily / Weekly	Track insider/major holder moves
6B	Fundamental Catalyst Overlay	Daily / Weekly	Validate flow with fundamentals
7	Big Money Score (BMS)	Continuous	Composite signal aggregation
8	False Positive Filter	Every alert	Reject noise and retail FOMO

TIER 1: PRIMARY FLOW SCREENERS

Run every 1-5 minutes during market hours (09:00-12:00, 13:30-16:00 WIB)

Screener 1A — Volume Anomaly Detector

Flags stocks experiencing volume spikes that exceed normal trading patterns, indicating potential institutional accumulation or distribution.

Field	Threshold	Rationale
Current volume vs 20-day average volume	$\geq 3\times$	Institutional accumulation cannot hide in normal volume
Current volume vs same-time-yesterday volume	$\geq 2.5\times$	Catches intraday acceleration vs prior session
Volume per minute (last 5 min) vs avg per minute	$\geq 4\times$	Flags sudden burst activity in real-time
Dollar value traded (IDR) in 5-minute window	$\geq \text{IDR } 5\text{B}$	Filters retail-driven penny stock pumps
Volume concentration in first 30 min vs full day	$\geq 15\%$	Early session accumulation signature

Required data: Tick-level volume, 1-min OHLCV, historical daily volume

Screener 1B — Price-Volume Divergence (Accumulation Signature)

Identifies stealth accumulation where large volume is absorbed without significant price movement — the classic signature of institutional buying.

Field	Threshold	Rationale
Volume vs 20-day average	$\geq 3\times$	Confirms institutional interest above noise
Price change (%) in high-volume window	$\leq \pm 1.5\%$	Big money absorbs supply without moving price
Bid/ask spread	$\leq 0.3\%$	Tight spread indicates controlled, patient accumulation
VWAP deviation	Price within $\pm 0.5\%$ of VWAP	No directional bias yet = stealth mode
Volume-weighted price vs open price	Within $\pm 0.8\%$	Distribution throughout day, not spike
Intraday volatility (ATR-based)	$\leq 50\%$ of 20-day ATR	Compressed volatility during accumulation

Required data: Tick data, Level 2 order book, VWAP calculation engine

Screener 1C — Block Trade Alert

Captures large off-market or on-market transactions that indicate institutional block crossing — often the cleanest big money signal.

Field	Threshold	Rationale
Single transaction size	$\geq \text{IDR } 1\text{B}$ OR $\geq 1\%$ of 20-day ADV	Size threshold for institutional block
Off-market / crossing flag	Yes	Block trades often cross away from lit market
Price vs last market price	Within $\pm 0.5\%$	No distressed selling at discount
Buyer/Seller broker code	Track repeat offenders	Identifies specific institutional brokers

Block trade frequency (same stock, 7 days)	>2 blocks	Sustained accumulation program
Block size vs average daily volume	>5%	Material enough to move supply/demand

Required data: Trade tape with broker codes, block trade reports, broker master list with classification

TIER 2: BROKER INTELLIGENCE SCREENERS

Run every 15-30 minutes — the single biggest alpha source in Indonesia

Screeners 2A — Broker Clustering

Detects when multiple large orders from the same or related broker codes concentrate on a single stock or sector, indicating coordinated institutional flow.

Field	Threshold	Rationale
Top 3 brokers buy volume / total buy volume	>40%	Concentration = coordinated flow
Same broker buying across 3+ stocks in same sector	Yes	Sector rotation signal
Foreign broker code net buy (session)	>IDR 10B	Foreign brokers = smart money proxy
Domestic institutional broker net buy (session)	>IDR 5B	Local fund / pension activity
Broker code in yesterday top buyers AND today	Yes	Sustained accumulation, not one-off
New broker in top 5 buyers (not seen in 30 days)	Yes	New institutional player entering
Broker buy/sell ratio	>2:1	Net accumulation, not two-way flow

Required data: Broker summary (broker code x buy/sell volume per stock), broker classification map (foreign/domestic/retail/institutional/insider)

Screeners 2B — Broker Code Velocity

Tracks sudden changes in a specific broker's activity level to detect the start or acceleration of an institutional accumulation program.

Field	Threshold	Rationale
Broker buy volume today vs 5-day average	>3x	Sudden interest spike above baseline
Buy/Sell ratio for target broker	>2:1	Net accumulation, not market-making
Broker average trade size	>IDR 100M per trade	Institutional ticket size vs retail
New broker code in top 10 buyers (30-day lookback)	New	New player = fresh capital
Broker velocity acceleration (3-day trend)	Increasing	Building position over time
Broker code associated with known institution	Yes	Map to parent (e.g., CLSA, Morgan Stanley)

Required data: Historical broker summary data (90-day), broker code master with institution mapping

TIER 3: FOREIGN FLOW SCREENERS

Run daily, updated intraday if foreign flow data is available in real-time

Screener 3A — Foreign Net Flow Spike

Monitors foreign investor capital flows as a proxy for global smart money positioning in Indonesia.

Field	Threshold	Rationale
Net foreign buy (market-wide, daily)	>IDR 50B	Broad risk-on signal for Indonesia
Net foreign buy (single stock, daily)	>IDR 10B	Stock-specific accumulation
Foreign buy vs 20-day average foreign flow	>2x	Acceleration above trend
Foreign ownership % change (weekly)	>+0.5%	Sustained accumulation, not trading
Foreign flow direction vs IHSG direction	Opposite	Contrarian smart money (buying dips)
Foreign flow persistence (3-day streak)	Net buy 3+ days	Position building, not speculation
Foreign flow vs regional peers	Indonesia outperforming	Country selection, not EM beta

Required data: IDX daily foreign flow report, KSEI foreign ownership data, stock-level foreign flow

Screener 3B — Foreign Broker Fingerprint

Identifies specific foreign institutional brokers known for research-driven, long-term positioning.

Field	Threshold	Rationale
Specific foreign broker net buy (e.g., CLSA, Morgan Stanley)	>IDR 5B	Known institutional brokers
Foreign broker buy concentration in non-LQ45	>30% of their flow	Alpha-seeking, not index-tracking
Foreign broker activity during market weakness	Net buy while IHSG < 1000	Bottom-fishing conviction
Foreign broker holding period (estimated)	>30 days avg	Long-term vs hot money
Foreign broker correlation with future returns	Positive (backtested)	Validate broker as smart money
Multiple foreign brokers buying same stock same day	>3 brokers	Conviction convergence

Required data: Broker-level foreign flow, broker code mapping to parent institution, historical broker performance

TIER 4: ORDER BOOK MICROSTRUCTURE SCREENERS

Run every 1-3 minutes — requires Level 2 message-level data

Screener 4A — Iceberg Order Detection

Reveals hidden large orders that refresh after partial execution, indicating an institution trying to minimize market impact.

Field	Threshold	Rationale
Large order (>IDR 500M) on bid, partially filled, times refreshes	3 times	Iceberg = hiding true size
Bid depth increase >50% without price movement	Yes	Hidden accumulation building
Cancel/replace ratio on large orders	<20%	Genuine intent vs spoofing/layering
Time between refresh of same size at same price	<2 seconds	Algorithmic execution pattern
Order size consistency across refreshes	>90% same size	Programmatic iceberg behavior
Price level held during refresh sequence	Within 1 tick	Defending a specific accumulation level

Required data: Level 2 order book with order IDs, message-level data (add/modify/cancel/execute)

Screener 4B — Order Book Imbalance

Measures sustained buying pressure through order book depth and dynamics.

Field	Threshold	Rationale
Bid volume / Ask volume (top 5 levels)	>3:1	Buying pressure building
Bid depth increase rate (lots/min)	>100 lots/min	Aggressive bid building
Large ask orders (>IDR 1B) eaten without price drop	Yes	Absorption = accumulation
Mid-price held within +/-0.1% for >10 mins despite volume	Yes	Controlled accumulation
Bid queue priority shift (new large bids jump queue)	Yes	Institutional urgency
Ask-side cancellation rate during bid buildup	>30%	Sellers withdrawing = supply squeeze

Required data: Level 2 order book snapshots (100ms), time-series of depth changes

TIER 5: CROSS-MARKET & CONTEXT SCREENERS

Run every 30-60 minutes — validates local signals with global and sector context

Screener 5A — Sector Rotation Flow

Detects when big money moves at the sector level rather than individual stocks, indicating thematic or macro-driven positioning.

Field	Threshold	Rationale
3+ stocks in same sector triggering Tier 1 screens	Yes	Sector-level big money
Sector foreign flow vs market-wide average	>2x	Sector overweight by foreigners
Sector index volume vs 20-day average	>2.5x	Broad sector interest
Leading stock in sector vs laggards	Leader up >3%, laggards flat	Sector accumulation in quality
Sector P/E re-rating (5-day change)	>+5%	Valuation expansion = inflow
Sector correlation with global sector ETF	>0.7	Global thematic alignment

Required data: Sector indices, sector constituent lists, cross-stock signal correlation matrix

Screener 5B — ADR / Global Proxy Flow

Uses global market instruments as proxies for foreign sentiment toward Indonesia.

Field	Threshold	Rationale
Indonesia-focused ETF (EIDO) volume spike	>2x average	Foreign sentiment proxy
MSCI Indonesia futures open interest + volume	Both increasing	Institutional positioning via futures
Regional peers (SET, KLSE, PSE) foreign flow	Correlated inflow	EM Asia risk-on confirmation
USD/IDR daily movement	>1%	Currency-driven foreign flow direction
Indonesia CDS spread change	<-10 bps	Improved sovereign risk perception
Commodity prices (coal, palm oil, nickel)	>+3% daily	Indonesia export-driven sector boost

Required data: Global ETF data, futures data, regional market flows, FX rates, commodity prices, CDS spreads

TIER 6: OWNERSHIP & FUNDAMENTAL CONTEXT SCREENERS

Run daily or weekly — provides fundamental validation for flow signals

Screener 6A — Ownership Change Alert

Tracks changes in beneficial ownership, insider activity, and strategic investor moves.

Field	Threshold	Rationale
Beneficial owner increase (weekly)	>+1%	Major holder accumulating
Treasury stock buyback announcement	Yes	Company believes undervalued
Strategic investor entry (new >5% holder)	Yes	Smart money with due diligence
Director/commissioner buy (insider report)	Any size	Legal insider accumulation signal
Pension fund / insurance ownership change	>+0.5%	Long-term institutional positioning
Activist investor 13D-style filing	Yes	Catalyst for strategic change

Required data: KSEI ownership changes, BEI disclosure filings, insider trading reports, treasury stock announcements

Screener 6B — Fundamental Catalyst Overlay

Validates that flow signals have fundamental backing rather than being purely technical or speculative.

Field	Threshold	Rationale
Earnings surprise (actual vs consensus)	>10% beat	Fundamental justification for flow
Analyst upgrade within 7 days	Target price +>15%	Institutional validation
Consensus EPS revision (4-week)	>+5%	Earnings momentum building
Free float percentage	<40%	Low float amplifies flow impact
ROE vs sector average	>1.5x	Quality bias in institutional selection
Debt/Equity ratio	<1.0x	Balance sheet strength for long-term holders
Dividend yield vs sector	>+1% premium	Income-focused institutional attraction

Required data: Earnings data, analyst consensus, free float data, financial statements, dividend history

TIER 7: BIG MONEY SCORE (BMS) COMPOSITE

Aggregates all tier signals into a single actionable score. Weights are dynamically adjusted based on backtested predictive power.

Component	Weight	Source Screener	Rationale
Volume Anomaly	20%	1A	Highest signal-to-noise for initial detection
Price-Volume Divergence	25%	1B	Best stealth accumulation signature
Block Trade	15%	1C	Cleanest institutional confirmation
Broker Clustering	15%	2A	Indonesia-specific alpha source
Foreign Flow	10%	3A	Smart money proxy with global context
Order Book Imbalance	10%	4B	Real-time pressure confirmation
Sector Context	5%	5A	Thematic validation

BMS Output Interpretation:

Score Range	Action	Description
0-49	Ignore	No significant big money activity detected
50-69	Monitor	Early signals present, insufficient confirmation
70-79	Watch List	Multiple signals converging, monitor for entry
80-89	Paper Trade	Meets minimum criteria for simulated execution
90-100	High Conviction	Multiple independent signals converging strongly

Required data: All Tier 1-5 outputs, real-time aggregation engine, weight optimization module

TIER 8: FALSE POSITIVE / NOISE FILTER

Applied to every alert before it reaches the BMS composite. Prevents retail FOMO, manipulation, and event-driven noise from polluting signals.

Filter	Rejection Threshold	Rationale
Retail buy ratio (retail brokers / total volume)	>60%	Retail FOMO, not institutional
Social media mention spike (Stockbit/Twitter)	>3x baseline	Hype-driven, not flow-driven
News sentiment (NLP on headlines)	Strong negative	Bad news = distressed selling
Stock price	<IDR 50	Penny stock manipulation risk
Market capitalization	<IDR 500B	Too illiquid for institutional size
Days since IPO	<30 days	IPO hype, not sustainable flow
Short-term RSI (14-day)	>80	Already overbought, late entry

Price already up >20% in 5 days	Yes	Chasing, not leading
Related party transaction flag	Yes	Insider dealing, not arm-length flow
UPT (Unusual Price Movement) halt in 7 days	Yes	Regulatory scrutiny, avoid

Required data: Broker classification (retail vs institutional), social media APIs, news feeds, fundamental data, regulatory halt history

COMPLETE DATA REQUIREMENTS SUMMARY

Data Category	Frequency	Latency	Source Examples
Tick-level trades + broker codes	Real-time	<50ms	RTI, broker DMA, exchange direct
Level 2 order book (message-level)	Real-time	<50ms	Exchange direct, institutional broker
Broker summary (aggregated)	15-min	15-min delayed	Stockbit, RTI, IDX
Foreign flow (market + stock)	Daily	T+1 official, intraday if available	IDX, KSEI
Ownership changes	Weekly	T+3 to T+7	KSEI, BEI disclosures
Block trades	Event	T+1 announcement	BEI announcements, broker reports
News + sentiment	Real-time	<1 min	Bloomberg, Reuters, web scraping
ADR / ETF / global flows	15-min	15-min delayed	Bloomberg, Yahoo Finance, ICE
Regional market flows	Daily	T+1	SET, KLSE, PSE exchange data
FX rates (USD/IDR)	Real-time	<1 min	Bloomberg, central bank
Commodity prices	Real-time	<1 min	CME, LME, Bursa Malaysia
CDS spreads	Daily	T+1	Markit, Bloomberg
Fundamental data	Quarterly	T+1 after release	Company filings, Refinitiv, FactSet
Analyst consensus	Daily	T+1	Refinitiv, Bloomberg, local brokers
Insider trading reports	Daily	T+1	BEI disclosures
Social media sentiment	Real-time	<5 min	Stockbit API, Twitter/X API, scraping

IMPLEMENTATION PRIORITY (Limited Resources)

If building sequentially, this priority maximizes signal quality per unit of development effort:

Phase	Screeners(s)	Timeline	Expected Impact
1	1A (Volume) + 3A (Foreign Flow)	Week 1-2	Highest signal-to-noise ratio
2	2A (Broker Clustering)	Week 3-4	Indonesia-specific alpha source
3	1B (P-V Divergence) + 4B (Order Book)	Week 5-6	Stealth accumulation detection
4	7 (Composite BMS) + 8 (Noise Filter)	Week 7-8	Actionable scoring system
5	1C (Block Trade) + 2B (Broker Velocity)	Month 3	Confirmation signals
6	5A (Sector) + 5B (Global)	Month 3-4	Contextual validation
7	6A (Ownership) + 6B (Fundamental)	Month 4-5	Long-term conviction overlay
8	4A (Iceberg) + Full optimization	Month 6+	Microstructure edge

KEY STRATEGIC INSIGHT

The broker code data is the single biggest alpha source in Indonesia specifically. Most global quantitative systems do not have access to this granular broker-level visibility, and the retail/institutional distinction is much clearer than in developed markets where market-making and HFT blur broker identities. Prioritizing Screener 2A (Broker Clustering) after basic volume/foreign flow provides an edge that is difficult to replicate with standard global data feeds.

This document is for informational and educational purposes only. It does not constitute financial advice. Screener thresholds should be backtested and calibrated to specific time periods and market regimes. Past performance of signals does not guarantee future results.
