

Money Flow Screener Specification

A comprehensive, professional-grade screening framework designed to track institutional capital deployment by pairing absolute fundamental quality ("What") with precise tactical confirmation ("When").

1. The "What" Screener: Fundamental & Institutional Quality

This scanning layer filters out market noise, isolating high-quality enterprises undergoing aggressive or quiet institutional accumulation.

A. Quantitative Growth & Business Quality

- **Accelerating EPS & Revenue Growth:** Filters for a minimum of 20-30% YoY growth in consecutive quarters, signaling expanding market share or structural tailwinds.
- **High Return on Invested Capital (ROIC):** Requires ROIC > 12-15% to guarantee that the company generates a premium return on its deployed capital pool.
- **Margin Expansion:** Identifies flat-to-expanding gross and operating margins, validating pricing power against inflationary or competitive pressures.

B. Smart Money & Institutional Footprint

- **Multi-Quarter Accumulation:** Flags stocks exhibiting increasing net positions by large financial institutions over 3+ consecutive quarters.
- **High-Conviction Weighting:** Screens for instances where asset managers are raising a stock's total weight within their portfolio, distinguishing active conviction from index matching.
- **Insider-Institutional Convergence:** Triggers when open-market insider purchases (Form 4 equivalents) align with institutional block acquisitions.
- **The "Silent Build" Metric:** Tracks anomalies where institutional ownership steadily climbs 5-15% per quarter while volatility and public retail interest remain compressed.

2. The "When" Screener: Technical & Liquidity Flow Trigger

Once the fundamental "Universe" is established, this layer continuously parses real-time market data to identify immediate institutional activity pushing the asset into markup phase.

A. Liquidity & Volume Dynamics

- **Relative Volume Surge (RVOL):** Demands daily volume to exceed $>2.0\times$ the historical 50-day moving average, signaling institutional block order execution.
- **Volume-Weighted Momentum (MFI):** Utilizes the Money Flow Index (MFI) to confirm that price moves are fully backed by volume. Screens for an upward trajectory without hitting overbought exhaustion (>80).

B. Structural Trend Alignment

- **Relative Strength Alpha:** Identifies stocks displaying extreme outperformance against the baseline benchmark index (e.g., JCI / IHSG) during market-wide pullbacks.
- **Moving Average Stack:** Enforces structural trend health, requiring the spot price to stay above an active 21-day EMA, while the 50-day SMA trends cleanly above the 200-day SMA.
- **High-Efficiency Breakouts:** Monitors specific multi-week chart consolidations for "Pocket Pivots" or clean breakouts into new 52-week structural highs on expansion volume.

3. Pipeline Orchestration & Execution Logic

To avoid false positives, individual criteria must follow a strict conditional hierarchy inside the rule engine:

Execution Step	Functional Engine	Conditional Logic Specification
Phase 1	Universe Screening	ALL baseline fundamentals must be met (e.g., Liquidity floor, positive ROIC, positive revenue acceleration). Erases low-tier float.
Phase 2	Smart Money Tracking	

Execution Step	Functional Engine	Conditional Logic Specification
		ANY major accumulation indicator triggered (e.g., significant foreign flow increase, block trade anomaly, or multi-quarter fund accumulation).
Phase 3	Tactical Trigger	ALL structural momentum conditions met (e.g., price clearance of 21-day EMA concurrently with an RVOL > 2.0x trigger). Validates entry.
