

CurrentFlow — Smart-Money Screening Process

LOCKED_SPEC v1.1 §2 pipeline · screeners.md funnel · Stockbit exodus DAL – private single-operator tool, observation-only until paper-validated

SOURCE · STOCKBIT EXODUS (BEARER, OWN SESSION) ~900 names

IHSG Universe
Full listed board. Server-side screener evaluates fitem_id filters across the whole market in one POST /screener/templates call — before any paywall-counted per-name pull.

SCR-0 · one screener call

SCR-0 · STAGE 0 / §3 · HARD GATE → ~100-150

Universe Eligibility
Screened: **Value MA20 > Rp 10 bn · Price > 100 · Free Float > 15%.**
Engine residual: exclude suspended/halted/UMA, IPO < 60 days, ARA/ARB-pinned close, incomplete broker summary (gap check).
Assign **Track A / B**, tag sector.

eligible universe (cached to DuckDB w/ as_of)

SCR-1 · §4 ACCUMULATION LEADS · OBSERVATION CANDIDATE LISTS

Accumulation Screeners — run in parallel, union & dedupe

SCR-1A · NBSA · WT 25

Foreign Accumulation
Scope **LQ45**. Foreign net buy > 2× MA20, buy streak ≥ 3d, flow MA20 > 0.
→ Track A lead.

SCR-1B · BROKER CONC. · WT 35

Bandar Accumulation
Scope **IDXSMC-LIQ**. Bandar Value > its MA20, net > 0, Accum/Dist > 0. → Track B lead.

SCR-1C · P-V DIVERGENCE · WT 30

Stealth Divergence
Bandar Value rising, 1M return < 3% (flat), Volume > 1.5× MA20 (effort).
Coarse pre-filter.

shortlist (union, deduped) – column values stored as SMS **component inputs**, not scores

DATA_SOURCES §6 · PAYWALL-FRUGAL

Engine pulls raw data for shortlist ONLY
broker_summary + ohlcv_foreign per surviving name. Then compute the un-screenable: top-2 broker share + Herfindahl, persistence, accumulator VWAP, true price-volume correlation, CMF, absorption, VSA effort-vs-result.

PIPELINE [3] · RULE A · HARD GATE (PRE-SCORING)

Wyckoff Phase Classifier
PASS only if Accumulation Phase C or D. Threshold detectors feed the classifier; they never bypass it. Everything else is rejected here — before SMS is ever computed.

phase ∈ {C, D}

PIPELINE [4] · §4 · INTERNAL UNTIL VALIDATED

Smart Money Score
Track-specific weights → SMS 0–100. Weights tune only via walk-forward Sharpe optimizer — never hand-edited. **Number stays hidden** (RULE B).

PIPELINE [5] · §5 · VETO FILTERS

Kill switches
Single-bandar monopoly (>60% one broker) · distribution · markup · wash trade · index-rotation (β-explained → –30%) · news. Any hit → drop.

SMS ≥ 70 AND phase ∈ {C,D} AND no veto

STATE · WATCHLIST

ARMED

Candidate carried to the watchlist. SCR-2 ($RVOL \geq 3\times$ + frequency spike) and SCR-3 ($Close > 20MA > 50MA, > VWAP, ADX > 20, RS > 0$) refine on ARMED names ahead of the trigger.

PIPELINE [6] · LD-3 · TECHNICAL TRIGGER

Entry Trigger

Spring-test OR LPS; compute stop + R:R; require $R:R \geq 2:1$; 9-day exhaustion cap.

SCR-4 · §7 · TILT, NEVER A GATE

Fundamental Tilt

Rank(Magic Formula) 13474 → tercile COMPOUNDER / NEUTRAL / SPECULATIVE → conviction $\times$ & hold horizon. Financials/utilities = FLOW_ONLY (skip MF, ROE>12% proxy). **Never blocks entry.**

PIPELINE [8]-[10]

Order Gen → Paper Fill → Risk/Exit

Limit @ trigger, size to 1% risk → IDX-aware fill (next-open + slippage, lot 100, tick bands, ARA/ARB reject, full fee stack) → stop · target · trailing · signal-decay exit.

SCR-EXIT runs continuously over open + ARMED → decay flag

SCR-EXIT · §8 SIGNAL-DECAY

Distribution / Mirror Warning

Accum/Dist < 0 · Foreign MA20 < 0 · sell streak > 2 → decay flag. Engine residual: UTAD/no-demand, dominant-broker flip, price-vs-flow divergence (the single best exit signal).

PIPELINE [11] · RULE B · VALIDATION AUTHORITY

Backtest ⇔ Forward-Paper

Separate code paths, **shared fill engine**. Promotes per-module validation state after PAPER_VALIDATION_MONTHS (default 3) of fill-realistic paper trading → flips observation ↔ claim.

PIPELINE [12] · §9 · STREAMLIT TERMINAL

Terminal UI

Observation modules · money-flow replay · heatmap · risk monitor · P&L / armed list / attribution vs LQ45/sector. Unvalidated modules show components only — no SMS, no probability, no buy/sell verb.

RULE A — Tradeability gate (LD-2)

The Wyckoff phase classifier is a hard gate **before** scoring at step [3]. Only Accumulation Phase C or D is tradeable. Detectors feed it; nothing bypasses it.

RULE B — Presentation gate (LD-9)

A module may show SMS / probability / rank / buy-sell claim **only after** it survives paper validation. Until earned: render the observation, no number attached. The paper engine is the sole promoter.

- Server-side screener (Stockbit)
- Engine compute (in-process)
- Hard gate / validation
- Veto / reject
- State
- Exit loop
- Terminal UI

Cadence: fires on broker-summary publication (~T+0 eve / T+1). SCR-0 → SCR-1(AuBuC) → engine → RULE A → veto → ARMED → SCR-2/3 → trigger → SCR-4 → fill → SCR-EXIT. No silent caps: anything a screener can't express is logged as an engine residual, never dropped.
