

CurrentFlow — Stock Pick Selection Flow

How ~900 IDX names narrow to one paper position · LOCKED_SPEC v1.2 §2 · thresholds from config.py · observation-only until paper-validated (RULE B)

~900 listed board

SOURCE · STOCKBIT EXODUS (BEARER, OWN SESSION)
IHSG Universe
Full listed board. One server-side POST /screener/templates evaluates fitem_id filters across the whole market **before** any payroll-counted per-name pull.

SCR-0 · one screener call

~100-150 eligible

SCR-0 · STAGE 0 / §3 · HARD GATE
Universe Eligibility
Screened: ADV(MA20) > Rp 10 bn · price > Rp 100 · free float > 15%. Engine residual gate, then assign **Track A** (LQ45/IDX80 & ADV≥25bn) or **Track B**, tag sector.

eligible universe (cached to DuckDB w/ as_of)

✗ **DROPPED HERE**
illiquid (<Rp10bn) · penny (<100) · **suspended** / **halt** / **UMA** · IPO < 60 trading days · ARA/ARB-pinned close · incomplete broker summary (gap) · corp action ±5 days

parallel

SCR-1 · §4 ACCUMULATION LEADS · OBSERVATION CANDIDATE LISTS
Accumulation Screeners — run in parallel, union & dedupe → shortlist

SCR-1A · NBSA · WT 25 (A)
Foreign Accumulation
Scope **LQ45**. Foreign net buy > 2x MA20, buy streak ≥ 3d, flow MA20 > 0.

SCR-1B · BROKER CONC. · WT 35 (B)
Bandar Accumulation
Scope **IDXSMC-LIQ**. Bandar Value > MA20, net > 0, Accum/Dist > 0.

SCR-1C · P-V DIVERGENCE · WT 30
Stealth Divergence
Bandar Value rising, 1M return < 3% (flat), volume > **1.5x** MA20 (effort).

shortlist (union, deduped) → stored as SMS component inputs, not scores

shortlist only

DATA_SOURCES §6 · PAYWALL-FRUGAL
Engine pulls raw data — shortlist ONLY
broker_summary + ohlcv_foreign per survivor. Compute the un-screenable: top-2 share + Herfindahl, persistence, accumulator VWAP, true price-volume correlation, absorption, VSA effort-vs-result.

phase ∈ C/D

PIPELINE [3] · RULE A · HARD GATE (PRE-SCORING)
Wyckoff Phase Classifier
PASS only Accumulation Phase C or D. Threshold detectors feed the classifier — they never bypass it. Rejected here **before SMS is ever computed**.

phase ∈ {C, D}

✗ **NOT TRADEABLE**
Phase A/B (range not confirmed) · **Phase E markup** (too late) · distribution / UTAD · no valid trading range

scored

PIPELINE [4] · §4 · INTERNAL UNTIL VALIDATED
Smart Money Score
Track-specific weights → SMS 0–100. Weights tune only via walk-forward Sharpe optimizer, never hand-edited. **Number stays hidden** until the module is paper-validated (RULE B).

survivors

PIPELINE [5] · §5 · VETO FILTERS
Kill Switches
Any single hit drops the name outright, regardless of SMS.

✗ **VETOED**
single-bandar monopoly > 60% · distribution-dressed · markup-on-thin-volume · wash/churn (min/max ≥ 0.7) · broker rotation (≥3d) · **retail FOMO > 60%** · event-driven

gate

◆ **ARMING DECISION**
SMS ≥ 70 AND phase ∈ {C, D} AND no veto

all three true

Server-side screener (Stockbit)

Engine compute (in-process)

Hard gate / decision

Veto / reject

State

The pick (paper position)

Funnel: ~900 → SCR-0 eligibility (~100–150) → SCR-1(AuBuC) shortlist → engine raw pull → RULE A phase gate → SMS → veto → ARMED → SCR-2/3 → trigger (R:R≥2:1) → SCR-4 tilt → order/fill = the pick. No silent caps: anything a screener can't express is an engine residual, logged, never dropped. Private single-operator tool · not investment advice · paper only.
